Detect

A fully integrated, market-leading, cloud-based facial recognition system that identifies excluded persons as they enter a gaming room, by matching them against images of excluded persons stored in the CONCERN Database.
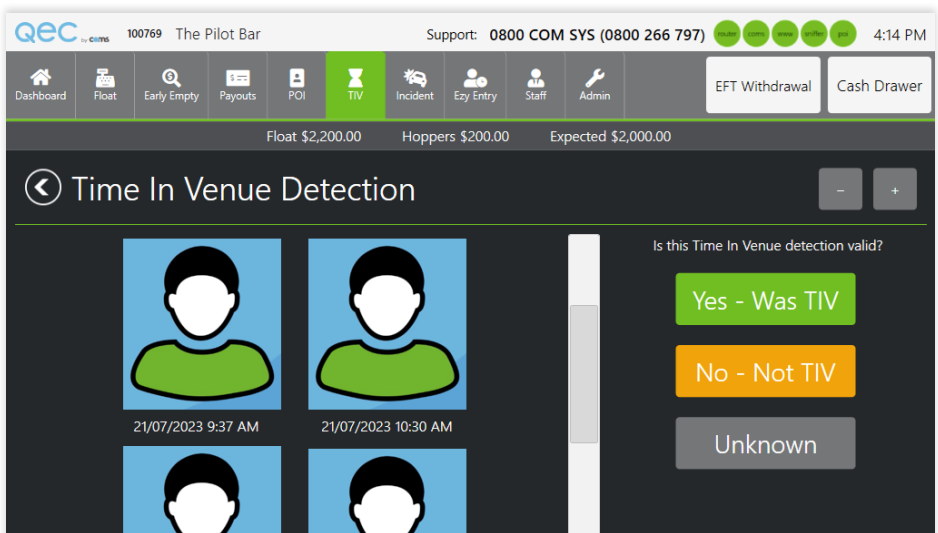

www.coms.net.nz
info@coms.net.nz

COMS Detect includes our new Time In Venue (TIV) function, which helps identify players who have been in your gaming area for an extended period of time.

KEY BENEFITS

» CONCERN Images are displayed on the QEC or POI Tablet, which enables your staff to view the excluded person information stored in Concern. This assists in the identification of a person who is excluded from your gaming area directly from your bar area, using their unique secure PIN.

» COMS Detect Automatically completes an automatic 'Incident Register' when a detection is made. Your venue staff simply confirm the detection on the QEC or POI Tablet, select the appropriate tick boxes on screen and enter any relevant comments.

» A secure link to download the completed report is emailed to the venue management and relevant gaming society.

» When an excluded Person is detected, the image of the person entering your gaming area is shown on the QEC or POI Tablet along side the source image from CONCERN.

» No need for your staff to sign into CONCERN directly, to confirm the excluded person's source image.

» COMS Detects' Time in Venue function scans the faces of all people who enter your gaming area.

» If the same person is identified in the gaming area numerous times over a specific time period, an alert is sent to your QEC or POI Tablet, to have your venue staff intervene (as per the new gaming regulations).
